AI Career Path Finder

Abstract

AI Career Path Finder is a Python-based AI system designed to help freshers identify suitable career roles based on their **resume, skills, education, experience, and interests**.

The system analyzes the user's profile and compares it with the skills and requirements of different career roles. It then suggests the roles that best match the user's current profile and shows the **skills they already have and the skills they need to improve or learn** for each role.

The user can then select a career role they want to pursue. Based on their current skills and the selected role, the system identifies the remaining skill gaps and generates a **personalized career roadmap**. The roadmap includes the skills and technologies to learn, projects to build, practice areas, and interview preparation topics.

As the user learns new skills and updates their profile, the system can reassess the skill gaps and provide an updated roadmap. The project aims to give freshers a clear understanding of their career options and a structured path to prepare for their desired role.
